

# TARGET

## Webinar 5 Managing suspected UTI - Learning Outcomes

By undertaking this webinar, participants will have increased

1. understanding that many patients with urinary symptoms do not have a proven UTI, so may not need antibiotics
2. understanding that antibiotic resistance to first line UTI antibiotics such as trimethoprim is increasing.
3. intention to carefully assess women's urinary symptoms to determine the likelihood of UTI
4. intention to use nitrofurantoin first line for most women with acute uncomplicated UTI
5. knowledge of the value of Pivmecillinam for the treatment of UTI, especially in the elderly.
6. intention to encourage self-care in the management of women with urinary symptoms.

7. intention to advise anti-inflammatories rather than antibiotics in the management of women with mild or 2 or less urinary symptoms.
8. intentions to share written information such as the TARGET UTI with patients consulting with urinary symptoms.
9. intention to undertake an audit of management, or antibiotic use of suspected UTI in my clinical setting.
